EASY SILAGE
YOUR SPECIALIST FOR SILAGE COVER SYSTEMS

PUTTING ON THE COVER, QUICK AND EASY
IDEAL FOR MULTI-LAYERED SILAGE PITS
OPTIMAL ROUGHAGE QUALITY

ONE MACHINE FOR MORE THAN ONE SILO
DETACHABLE ROLLER
CUSTOM WORKMANSHIP

15 YEARS EXPERIENCE
PORTAL SYSTEM

Dragging foil, sandbags and car tyres in all kind of weather conditions, several times a year. The traditional way of covering clamp silos is a tedious and laborious job. Using the innovative Easy Silage cover system, this is a thing of this is past!

The portal system runs parallel to the silo wall. This system will fit almost any silo. The roller used to pick up the cover can be left on the silo while a second roller is picked up for the next silo. The machine is also adjustable up to 3 metres in width and 2.5 metres in height.

After filling the silo, covering the clamp silo is a breeze. It only takes 30 minutes for one person to put on the cover. Everything works on remote control. It takes very little effort to roll the cover onto the roughage. The cover is subsequently attached to the filling and overflow system. Turn on the water pump to fill the cover in about two hours. The water system fills the hoses evenly.

The end roller on the cutting face of the silage creates a proper barrier and prevents the cover from being blown about in the wind. Also, the end roller prevents any overheating of the roughage. In winter, fill the system with salt water, if so desired. This will make the system work well, even in wintery conditions. While the filling process goes on, the operator may sit down and relax or perform some other tasks. That is because the pump will automatically shut down when the system is full.

The portal system ideally suits multiple large clamp silos, since the system can easily move from one silo to the next. Then, the machine will take the next roller to cover the silo.
EASY SILAGE, YOUR SPECIALIST FOR SILAGE COVER SYSTEMS
RAIL SYSTEM

The rail system runs in a channel onto the silo wall. The channel is mounted onto the clamp silo using special brackets. This system will fit almost any silo. The machine is also adjustable up to 2.5 metres in height and as much as 3 metres in width. Covering the roughage occurs in the same way as described in the portal system.

EASY SILAGE COVERSYSTEMS

Easy Silage cover systems are suitable for clamp silos up to 100 metres long and 25 metres wide. Easy operation is by way of a remote-control device. Since all farms are unique in the way they operate, the cover systems are made to measure.

Four different power supply systems to choose from:
- Solar
- Mains supply
- Generator
- Tractor

The width and height of machine are adjustable and the roller can be taken off, if so desired.

THE ES ROLLERSYSTEM

The ES roller system with the hydraulically driven roller is operated from the tractor, telescopic loader or shovel, and is matched to the lifting power of your machinery.

The roller system is the simple solution for silos that are not wider than 12 metres. Filling the water hoses is in the same way as with the portal and rail systems.

EASY SILAGE, YOUR SPECIALIST FOR SILAGE COVER SYSTEMS
Today, many dairy farmers choose to increase the capacity of their clamp silos. This will change the process of silo filling. The various grass cuttings are put on top of one another. The cover system covers the silage quickly and easily. The end roller on the cutting face of the silage creates a proper barrier and prevents the cover from being blown about in the wind. Also, the end roller prevents any overheating of the roughage.

The water system fills the hoses evenly. In winter, fill the system with salt water, if so desired. This will make the system work well, even in wintery conditions.

Apply the vertical cutting method when taking the silage from the silage silo. This will result in constant top-quality roughage during the entire feeding period. In addition, this will increase your milk production.
MORE INFORMATION ABOUT EASY SILAGE?

Easy Silage BV is specialised in covering clamp silos. The Company is located at Dearsum in the centre of the province of Friesland, known as the dairy province of the Netherlands.

Many years of experience and product knowledge of our various partners in the field have created a product that can be customised to suit our customers’ needs.
